Video 6: Session Cookie Exercise (05:05)

So, how do we know that the session cookie is being stored on the browser? Well, here I am, I'm running the web server here in VS Code. Now, over here I've got my browser and I can access the books. So, for example, here it's going to render the books. I've got a statement here that if I hit the route books, then I'm trying to get the session ID from session username here and it was successful. It ran through here and it managed to get that. But let me know go to my browser and I'm going to go to settings.

So, if you come down here and go to settings, you come to a page like this and if we scroll down here, here I've got cookies and other data. Let's scroll down. I'm allowing all cookies and down here I can see all cookies and here's my cookie. This is the session cookie, there it is. Let's remove it. So, I'm going to get rid of the cookie, the session cookie on my browser now it's gone. Let's go back now and hit list books again. It gives an error. It gives an error because here it couldn't get session username.

Let me put a break point here so I can show you. So, I'm going to step back and here list books. Now, I'm here and we're about to try and access session username and we'll see that it can't get it. It doesn't exist. Now let's go back and see if I actually register. Test user, test user, submit it, now list books. Here we are, we're breaking on this and now. So, here we are and the user is test user. So, this shows that the browser is passing the session cookie back to the web server.

So, I hope you understand that on the right here, I've got the web server and on the left I've got the browser and you can go in and you can look at your see all the cookies and site data here. I've just got the localhost one, which is mine that I've set. I wanted to show you what happens if I hit Amazon. So, let me just hit that Amazon web page. Take a look now at see all the cookies. I want you to see how many they added. So, that was just hitting the Amazon site. I've got cookies from Zeotap, Yahoo, Twitter, Tabula, etc.

All these cookies just with that one hit on Amazon website. But I hope I've shown you that we can place cookies on the browser and we place the session cookie and now we can check it here.

What I want you to do is an exercise is to put a try block in here so that if we don't have the session cookie that we redirect the user to this register. If they do have the session cookie then we render books.html. So, put a try block in here to check if this session cookie exists. Okay, that's your exercise. Okay, bye for now.
