Video 8: Enhancing a Website Using Bootstrap (08:58)

So, let's take advantage of bootstrap to make our website on Flask look a lot cleaner, and more functional. So, go to the docs, or to examples, but here we can find examples of all the things that we need to do. So, for example, I'm going to need a navigation bar. And so if we go to Navbar here, it'll tell us how it works and it'll show us examples of a navigation bar. So, let's go and first download. So, to example of downloading, we don't actually need the source, what we can do is we can just do a link to it. So, we can copy that and I've already copied one of these and so let's go to our code and we'll include that link in our code.

So, one of the first things I'm going to do is I'm going to go to the index of html template and I'm going to insert bootstrap. So, this will be the cascading stylesheet and we're just putting a link to bootstrap.min.css. So, this will load bootstrap for us. Now the next thing I'm going to do is I'm going to change the navbar and I'm going to just copy this that I've made already and replace our navbar with a more extensive navbar. In this case, we've got roots to home, books, add book, add image, and delete book. Okay, there's the navbar. Now, I'm in the body. Let me insert this div here, and we'll end the div down here. So, we're within the body and here. So, we'll just save that. So, we'll run the code and now we'll just hit the website. So, let's first go to 5000. So, this looks like, I see that if I expand it, we'll see the navbar. We can log in, test user and test user, and we can get the books. And now we need to make sure we've got a route to 'add book.'

So, let's add a new route addbook. So, here we're going to add a book, and to do that, we're going to need to get a template addbook.html. So, let's go to our templates and I'm going to copy the register because this is the one that has a form in it. And I'm going to create a file, addbook.html and we'll put in there this, and instead of username, we need author, and that will be author and title. And now, the action should be to go, and we're going to pass this to addbook. So, let's take a look, that looks good. We're inheriting, so everything should be fine. We don't need this. Okay, going to save that and let's run. I believe we're okay that let's bring back up the browser and now let's log in with test user. And now, it's because this is too small, okay.

And now we need to add a book. Okay, add a book. Yes, now goes to 'add book,' list books, list books fine. So, now we have quite a good looking site. So, let's have a route to add images.

So, here I am going to have this route as addimage. We're going to render a template, addimage.html. So, let me go and show you the template. So, here's the template. Now, this is just standard that we're going to have a form in which we're going to allow the user to select an image and once the action will be addimage, and we'll make it a post method. This will allow us to select a file and to upload it. So, I'm just going to save that. Let's go back to our add images. We'll have addimage.html and let's save that. So, up here we need to add the destination of where these photos need to be loaded, and I'm saying let's load them under a directory called "static".

At the moment, we don't have that directory, so let's create it at the same level here as this folder static. There we go. Now we've got a static folder that the files can be loaded into and we've got our addimage. Now here we need to, if it's a post, we need to get the file that this is an object and it's associated with the image that's going to be uploaded. I'm going to get the number that we want to associate with that image and I'm going to name it as image plus that number, that id, and we're only allowing PNG files at the moment. And then we save, we do image.save to that path that we just defined as upload photos. So, that's to static and we can upload other files as well as images by the same mechanism. Add image, browse, this allows us to select an image. Now it'll only pick out the PNG files. Here's one. Open it and let's put that with book number one and submit it. And the image is uploaded. That's great. And if we go back to our directory here and look under static, see, we've got image1. So, we have our new roots and we're going to come back and we're going to protect them from unauthorized users. Okay, bye for now.
